

Travel Booking Platform (Hotel, Cab, Flight)

ABSTRACT

Objective:

The main objective of this project is to develop a user-friendly Travel Booking Platform that brings hotel, flight, and cab booking services together in a single application. The system is designed to make travel planning easier by allowing users to search, compare, book, and manage their entire trip from one place, eliminating the need to switch between multiple websites or applications.

Existing System:

In the current travel industry, users often depend on multiple applications or websites to book flights, hotels, and cabs. This creates several challenges during travel planning and management.

Multiple Platforms: Users need to switch between different applications to complete their travel arrangements.

Time-Consuming Process: Travel details must be entered repeatedly across multiple booking platforms.

Lack of Integration: Flight, hotel, and cab bookings are often managed separately, making trip planning more difficult.

Limited Recommendations: Many systems do not provide integrated suggestions that help users complete their travel plans.

Complex Booking Management: Tracking and managing bookings from different platforms can be confusing and inconvenient.

Proposed System:

The proposed Smart Travel Booking Platform provides a centralized solution for managing travel services through a single application. The system combines flight, hotel, and cab booking modules while offering a personalized and user-friendly travel experience.

Individual Booking Facility: Users can book flights, hotels, or cabs separately according to their requirements.

Smart Recommendations: After a flight is selected, the system automatically suggests hotels and cab services based on the destination and arrival time.

Travel Synchronization: Flight schedules are synchronized with hotel check-in timings and cab availability to help users plan their trips effectively.

Flexible Booking Options: Users can either proceed with only the selected service or choose additional recommended services to create a complete travel plan.

Centralized Dashboard: All bookings can be viewed, managed, modified, or cancelled through a single dashboard.

Travel History Management: Users can access their previous bookings and travel details whenever required.

Identified Users, Roles and Responsibilities:

1. Customer/User

- Register and create an account using valid personal details.
- Log in securely and manage their profile information.
- Search for available flights, hotels, and cab services based on travel requirements.
- Compare available services based on price, availability, location, timing, and other details.
- Book flights, hotels, and cabs individually or as part of a complete travel plan.
- Receive hotel and cab recommendations based on selected flight details, destination, and arrival time.
- View booking details, payment information, and booking status.
- Modify or cancel bookings according to the applicable booking conditions.
- View previous bookings and maintain their travel history.
- Receive booking confirmations and important travel-related notifications.

2. Administrator

- Manage registered users and maintain user account information.
- Add, update, or remove travel service providers and their service details.
- Manage flight, hotel, and cab information available on the platform.
- Monitor customer bookings, cancellations, and transactions.
- Verify and maintain the accuracy of service and availability information.
- Manage system data, booking records, and administrative reports.
- Handle customer complaints, queries, and booking-related issues.
- Monitor system activities and identify errors or unusual activities.
- Maintain platform security and ensure authorized access to administrative functions.
- Ensure the overall system operates smoothly and that travel services remain properly synchronized.
- Generate reports related to users, bookings, revenue, cancellations, and service usage.

3. Service Provider

- Register and maintain service-provider information.
- Add and update available flights, hotels, or cab services.
- Manage pricing, schedules, availability, and service details.
- View customer bookings related to their services.
- Update booking status and availability in the system.
- Respond to service-related customer requests when required.
- Coordinate with the administrator regarding service information and issues.

Technology Stack:

- Frontend: HTML, CSS, JS
- Backend: Python, Fast API / Django
- Database: MySQL
- Development Tool: Visual Studio Code
